General Information

In many industrial sectors and fields of research, temperature measurement is one of the most important parameters which determines product quality, security, and reliability. Temperature sensors are available in several types all of which have a unique performance characteristic. The performance capability of the various sensors are a result of the manufacturing process and component materials associated with their technologies and intended application. It is IST Charter to produce sensors that exceed the industry standard of temperature measurement with additional capability to directly replace older traditional methods and provide the maximum performance. To this end IST has concentrated its development and manufacturing on the process and materials of high-end thin-film temperature sensors. Additionally these processes, partially derived from the semiconductor industry allows IST to manufacture sensors in very small dimensions. Because of their low thermic mass thin-film temperature sensors exhibit a very short response time. IST core technology and processes results in thin-film sensors that combine the good features of traditional wire wound platinum sensors such as accuracy, long-term stability, repeatability, interchangeability and wide temperature range, with the advantages of mass-production, which contributes to their optimal price/performance ratio.

Sensor Construction

The temperature sensor consists of a photo-lithographically structured, high-purity platinum coating arranged in the shape of a meander. The platinum thin-film structures are laser trimmed to form resistive paths with very precisely defined basic value of the resistivity. The sensors are covered with a glass passivation layer; to protect the sensor against mechanical and chemical damage. The bonded leadwires which are additionally covered with a drop of glass make electrical contacts to the resistive structure.

Typical Features

– brief response time
– excellent long-term stability
– low self-heating rate
– excellent price/performance ratio
– small dimensions
– resistant against vibration and temperature shocks
– simple interchangeability

Response Time

The response time $T_{0.63}$ is the time in seconds the sensors need to respond to 63% of the change in temperature. The response time depends on the sensor dimensions, the termal contact resistance and the encloser medium.

Long-Term Stability

The change of ohmage after 1,000 hrs at maximum operating temperature until the 7W types amounts to less than 0.03%.

Self Heating

To measure the resistance an electric current has to flow through the element, which will generate heat energy resulting in errors of measurement. To minimize the error, the testing current should be kept low (approximately 1 mA for pt-100). Temperature error $\Delta T = RI^2 / E$; with E = self-heating coefficient in mW/K R = resistance in kΩ, I = measuring current in mA

Measurement current

The amount of thermal transfer from the sensor in application determines how much measuring current can be applied. There is no bottom limit of the measurement current with platinum thin-film. The measurement current depend highly on the application in use. For sensors from 750°C - 1000°C (7W, 8W, 10W) the measurement current must limited at max. 1 mA.

We recommend at:

100 Ω:	typ. 1 mA	max. 5 mA
500 Ω:	typ. 0.5 mA	max. 3 mA
1000 Ω:	typ. 0.3 mA	max. 2 mA
2000 Ω:	typ. 0.2 mA	max. 1 mA
10000 Ω:	typ. 0.1 mA	max. 0.3 mA

Platinum Temperature Sensors

Nominal values

The nominal or rated value of the sensor is the target value of the sensor resistance at 0° C. The temperature coefficient α is defined

as $\alpha = \frac{R_{100} - R_0}{100 \cdot R_0}$ [K^{-1}] and has the numerical value of 0.00385 K^{-1} according to DIN IEC 751.

In practice, a value multiplied by 10^6 is often entered: TCR = 10^6 * $\frac{R_{100} - R_0}{100 \cdot R_0}$ [ppm/K].
In this case, the numerical value is 3850 ppm/K.

Temperatur Characteristic Curve

The characteristic temperature curve determines the dependence of the electrical resistivity on the temperature. The following definition of the temperature curve according to the DIN EN 60751 standard applies:

-200 bis 0°C $R(t) = R_0 (1 + A * t + B * t^2 + C * [t-100] * t^3)$

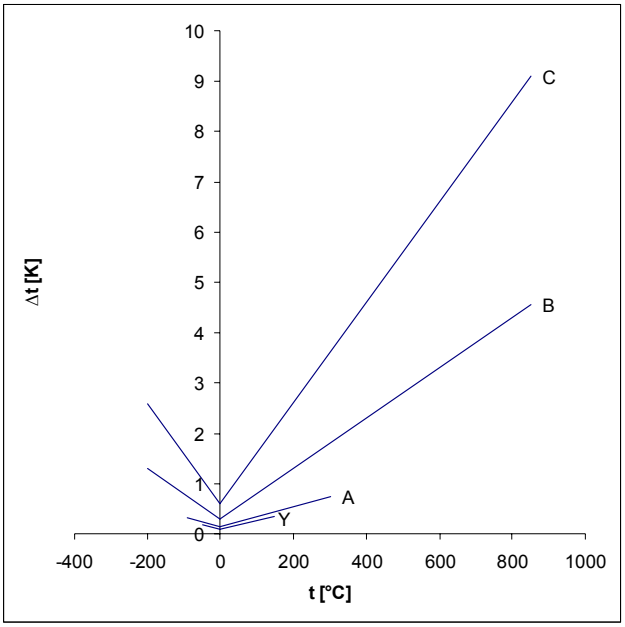
0 bis 850°C $R(t) = R_0 (1 + A * t + B * t^2)$

Platinum (3850 ppm/K):
$A = 3.9083 * 10^{-3}$ [$°C^{-1}$]; $B = -5.775 * 10^{-7}$ [$°C^{-2}$];
$C = -4.183 * 10^{-12}$ [$°C^{-4}$]

Platinum (3750 ppm/K):
$A = 3.8102 * 10^{-3}$ [$°C^{-1}$]; $B = -6.01888 * 10^{-7}$ [$°C^{-2}$];
$C = -6 * 10^{-12}$ [$°C^{-4}$]

Platinum (3770 ppm/K):
$A = 3.92 * 10^{-3}$ [$°C^{-1}$]; $B = -6.03 * 10^{-7}$ [$°C^{-2}$];

R_0 = Resistance value in ohm at 0°C;
t = temperature in accordance with ITS 90



Tolerance field

Tolerance Classes

temperature sensors are divided into classes according to their limit deviations:

Class	+/- limit deviations in °C (K)	IST AG designation	area of validity of temperature class
DIN 60751, class B	0.30 + 0.005 x | t |	B	-200°C bis 850°C
DIN 60751, class A	0.15 + 0.002 x | t |	A	-90°C bis 300°C
⅓ DIN 60751, class B	0.10 + 0.0017 x | t |	Y	-50°C bis 150°C
2DIN 60751, class B	0.60 + 0.01 x | t |	C	-200°C bis 850°C
1/5 DIN 60751, class B	0.06 + 0.001 x | t |	1/5	on request
1/10 DIN 60751, class B	0.03 + 0.0005 x | t |	1/10	on request

\| t \| is the numerical value of the temperature in °C without taking into account either negative or positive signs.
Special selection of sensors upon request (e.g. pairings, grouping, special tolerances)

Platinum Temperature Sensors

PW – Product Series — Temperature Range: -200°C...+600°C

Temperature range from -200°C to +600°C at DIN 60751 class A
Lowest hysteresis
Temperature sensors with wire connections
Platinum wire 0.2 mm x 7 mm (Ø x L), (solderable, weldable, crimpable)
Temperature coefficient 3850 ppm/K

Dimensions in mm	Nominal Resistance at 0°C in Ohm	Chip-Dimensions in mm	Description
	100	LxW 2.5 x 1.6	PW0K1.216.7W.x.007
	500	LxW 2.5 x 1.6	PW0K5.216.7W.x.007

PG – Product Series — Temperature Range: -200°C...+600°C

Temperature range from -200°C to +600°C at DIN 60751 class A
Lowest hysteresis
Temperature sensors with wire connections
Platinum wire 0.2 mm x 7 mm (Ø x L), (solderable, weldable, crimpable)
Temperature coefficient 3911 ppm/K

Dimensions in mm	Nominal Resistance at 0°C in Ohm	Chip-Dimensions in mm	Description

Platinum Temperature Sensors

CustomSens

Thin-film temperature sensors with universal connection possibilities

It is the policy of IST to put forward as many sensor options as possible to best serve the customers needs. True to this policy is the CustomSens product. We are bringing a new range of sensors on to the market which will provide enormous versatility. The highlight of these thin-film temperature sensors is the flexibility of determining your own wire termination type or style as required. You can decide how much work we should take off your hands in the assembly of the sensors. You can choose between short or long connections, whether they are to be bare or insulated and whether the sensor is to be completed in 2-, 3- or even 4-wire technology. It is not only the great choice of these variables which offers you many advantages. Through the customized connection structure, the sensors are also characterized by superior product properties, giving you a double benefit.

Universal possibilities

Below you will find all the variables at a single glance. When you combine these with your requirement profile, you will obtain a customized sensor.

1. Dimensions in mm:				
2. Nominal resistance:	100 Ohm	500 Ohm	1000 Ohm	10000 Ohm
3. Temperature range:	150°C	200°C	400°C	600°C
Wire material:	Enameled Copper Wire	Teflon insulated	Silver bare	Pt/Ni bare
Wire diameter:	0.2 mm	AWG 26/30/32 Stranded Wire AWG 28/7	0.25 mm	0.2 mm
4. Number of wires:	2-Wires	3-Wires	4-Wires	
5. Wire length:	5 mm	up to	1000 mm	
6. Tolerance:	DIN EN 60751 Class B	DIN EN 60751 Class A		
7. Metallised backside:	NiCr/Ni/Au -200°C + 400°C	Pt -200°C + 600°C
